

Percola®

“An Aesthetic SUDS Solution”

The Percola® paving form a free-draining structurally stable surface with a variety of finishes that can be designed to enhance the external landscape. The concrete pavers are water-permeable because of the circular voids that are formed at the intersection of the blocks. The holes are filled with natural stone or a permeable product that allows water to pass through to the sub-structure preventing flooding and run-off. The final surface will have 12% voids that will ensure the long-term water permeable effect of the pavers.

The nominal dimensions of the Percola® are 200x200x80 mm with a bevelled edge of 4-5 mm and conform to BS EN 1338 and PTV 122. Percola® are available in both standard concrete and Novostones® finishes. The Novostones® range includes an extensive variety of colours many of which are similar to natural granite. The Percola® can be incorporated into the Novostones® paving range providing a complete design concept.

Piove®

“A Definitive SUDS Solution”

The Piove® are precast permeable concrete blocks conforming to BS EN 1338 and PTV 122. When laid they create a permeable surface that allows water to drain away quickly preventing flooding and surface water run-off. The paviors are available in two standard sizes of 200x200x100mm and 100x100x100mm, other sizes are available on request. Each block has a bevelled edge of 3x4mm and a durable surface that results from the high compression and materials used in their manufacture.

Piove® are available in a range of colours including the standard grey, red, and black. Other bespoke colours can be manufactured to meet a specific requirement. The porous blocks have been rigorously tested to confirm that with minimal maintenance the flow rate does not reduce over time. The system has the advantage of not requiring the jointing aggregate to be replaced to retain the paved areas integrity.
